WildEye Analyzer

Quick Help for First-Time Users

A short guide to get you from trap photos to a wildlife log.

---

1. What WildEye does

WildEye looks at your camera-trap photos and builds a simple wildlife log. For each photo it records when it was taken, what animal (or person) is in the frame, how many individuals, and what they appear to be doing.

You upload photos → WildEye analyzes them → you download a spreadsheet. No Google sign-in is required for this tool.

2. Key features at a glance

- Upload Folder or Individual Files — bring in a trap card dump or selected shots.
- Folder name fills extra Excel columns (SourceFile, Senna, year, trap nights) when named the FFS way — see section 3.
- AI species ID — tuned for Forest First Station C8 (Wayanad) naming rules.
- Smart skips — empty-looking frames and photos already in your log can be skipped.
- Burst handling — quick-fire shots are grouped so one clear ID can help nearby frames.
- Stop anytime — halt remaining photos mid-run; finish later with Analyze again.
- Download Excel — Human (armed) rows show in red. Multi-species frames can list two names joined with +.
- Species Rules & Mark error — read the rule book; flag a wrong ID in preview so the next run can improve.
- Log Library & Import Log — past runs in this browser, or import an old spreadsheet into the backup database when configured.

3. Name your trap folder the FFS way

When you use Upload Folder, WildEye reads the folder name and fills four extra columns in your spreadsheet. Individual Files alone usually leave these blank.

Pattern (pieces separated by underscores _):

`CN_7_FFS_2_23Feb2026_NR_2021_31`

- **SourceFile** — first five parts: CN_7_FFS_2_23Feb2026
- **Senna Removed/Not Removed** — next flag: NR → Not Removed, R → Removed
- **Year of removal** — e.g. 2021
- **Trap nights** — e.g. 31

Tips: Use underscores only between pieces. Incomplete names are OK — WildEye fills what it can and leaves the rest blank. Pick the trap folder itself (not a parent of many traps) so the name matches one station dump.

4. Your first analysis (step by step)

Step A — Open WildEye

Go to your WildEye web address in Chrome or Safari. You should see the Forest First logo and “WildEye Analyzer” on the left.

Step B — Add photos

On a computer: tap Upload Folder (starts in Downloads) or Individual Files. On a phone: tap Choose photos and pick from Google Drive or Files.

JPEG, PNG, WebP, and HEIC are supported. About 50 photos per session is recommended; more is allowed and uploads in small batches.

Use Select all / Deselect all / Remove selected to tidy the list. Tap a row to preview.

Step C — Optional: existing log

If you already have a CTA_*.csv / Camera_Trap_Analysis*.csv (or Excel), upload it under Existing Log. New results will append instead of starting from scratch.

Step D — Run analysis

Tap Analyze (or Analyze N new photo(s)). Watch progress: Analyzing → Done. Large folders may show Batch N/M.

Need to pause? Tap Stop. The photo already in flight may finish; the rest wait. Tap Analyze again later for what is left.

Step E — Download your log

When the run completes, tap Download. You get a file like CTA_YYYY-MM-DD_HHmmss.xls. Open it in Excel or Sheets. Rows are sorted by photo name (I__00071 before I__00120).

5. Reading your results

- Species Name — animal common name, Human, Human (armed), Unidentified, or a short “no animal” description.
- Two clear species in one photo — may appear as “Sambar Deer + Spotted Deer” (names joined with +); count is the total animals.
- Partial animal at the edge — WildEye should still name the species when the body is clear enough (not treat it as empty).
- Human (armed) — person clearly with a weapon. Shown in red in the app and Excel. Review carefully.
- Number of Individuals & Behavior — count and activity from the AI.
- Date & Timestamp — from the trap photo metadata when present.
- SourceFile / Senna / Year / Trap nights — from the upload folder name (section 3).
- Already done — this photo name was already in your session log or backup; WildEye did not re-analyze it.

6. Rules and feedback you should know

- Species Rules (left menu, under Import Log) — read the Station C8 wild-animal rules the AI uses.
- Mark error in preview — if a species is wrong, open the photo, mark the error and add a short comment. That feedback can improve the next analysis.
- Wrong species report — note the photo name (e.g. I__00046) and tell your WildEye maintainer so Station C8 rules can be tightened.
- Help (left menu) — Quick Help PDF and email Forest First (forestfirst.ai@gmail.com).

7. Handy tips

- Stay in the same browser session to keep adding photos; finished ones stay unchecked so you only analyze what’s new.
- Clear results & re-analyze all wipes this session’s memory. Rows already in the backup database may still be skipped until removed there.
- Log Library keeps a short history of past downloads in this browser only.
- Import Log loads an old spreadsheet into the backup database — no new photos needed.
- If a Drive photo says it has no data, open it once in Google Drive so it fully downloads, then Choose photos again.

8. Quick troubleshooting

- No new look after an update: hard-refresh (Cmd+Shift+R / Ctrl+Shift+R).
- Analyze does nothing: check that at least one waiting photo is selected.
- Stop didn’t seem instant: the current upload may finish; later batches should not start.
- Folder columns blank: the folder name may not follow the FFS underscore pattern, or you used Individual Files without a trap folder.
- Wrong species: use Mark error in preview, or note the photo name for your maintainer.
