WildEye Analyzer

Quick Help for First-Time Users

A short guide (2 pages) to get you from trap photos to a wildlife log.

1. What WildEye does

WildEye looks at your camera-trap photos and builds a simple wildlife log for you. For each photo it records:

- When the photo was taken (from the photo's own date/time, when available)
- What animal (or person) is in the frame
- How many individuals
- What they appear to be doing (moving, standing, foraging, and so on)

You upload photos → WildEye analyzes them → you download a spreadsheet. No Google sign-in is required for this local Path A tool.

2. Key features at a glance

- **Upload Folder or Individual Files** — bring in a trap card dump or selected shots.
- **AI species ID** — tuned for Forest First Station C8 (Wayanad) naming rules.
- **Smart skips** — empty-looking frames and photos already in your log can be skipped to save time.
- **Burst handling** — quick-fire shots are grouped so one clear ID can help nearby frames.
- **Stop anytime** — halt remaining photos mid-run; finish later with Analyze again.
- **Download Excel** — open in Excel or Google Sheets. **Human (armed)** rows show in red.
- **Log Library & Import Log** — revisit past runs in this browser, or import an old spreadsheet into the backup database when configured.

3. Your first analysis (step by step)

Step A — Open WildEye

Go to your WildEye web address in Chrome or Safari. You should see the Forest First logo and "WildEye Analyzer" on the left.

Step B — Add photos

1. On a computer: tap Upload Folder (starts in Downloads) or Individual Files.
2. On a phone: tap Choose photos and pick from Google Drive or Files.
3. JPEG, PNG, WebP, and HEIC are supported. About 50 photos per session is recommended; more is allowed and will upload in small batches.
4. Use Select all / Deselect all / Remove selected to tidy the list. Tap a row to preview.

Step C — Optional: existing log

If you already have a CTA_*.csv or Camera_Trap_Analysis*.csv, upload it under Existing Log. New results will append instead of starting from scratch.

Step D — Run analysis

Tap Analyze (or Analyze N new photo(s)). Watch the progress bar and per-file status: Analyzing → Done. Large folders may show Batch N/M because the cloud splits uploads into safe sizes.

Need to pause? Tap Stop. The photo already in flight may finish; the rest will wait. Tap Analyze again later for what is left.

Step E — Download your log

When the run completes, tap Download. You get a file like CTA_YYYY-MM-DD_HHmmss.xls. Open it in Excel or Sheets. Rows are sorted by photo name (I__00071 before I__00120).

4. Reading your results

- Species Name — animal common name, Human, Human (armed), Unidentified, or No animal detected.
- **Human (armed)** — person clearly with a weapon. Shown in red in the app and in the Excel file. Review these carefully.
- Number of Individuals & Behavior — count and activity from the AI.
- Date & Timestamp — from the trap photo metadata when present.
- Already done — this photo name was already in your session log or backup; WildEye did not re-analyze it.

5. Handy tips

- Stay in the same browser session to keep adding photos; already-finished ones stay unchecked so you only analyze what's new.
- Clear results & re-analyze all wipes this session's memory. Rows already saved in the backup database may still be skipped until removed there.
- Log Library (left menu) keeps a short history of past downloads in this browser only.
- Import Log is for loading an old spreadsheet into the backup database — no new photos needed.
- If a Drive photo says it has no data, open it once in Google Drive so it fully downloads, then choose photos again.

6. Quick troubleshooting

- **No new deployment / old look:** hard-refresh (Cmd+Shift+R / Ctrl+Shift+R) after a site update.
- **Analyze does nothing:** check that at least one waiting photo is selected.
- **Stop didn't seem instant:** the current upload may finish; later batches should not start.
- **Wrong species:** note the photo name and tell your WildEye maintainer — Station C8 rules can be tightened.
